

Louis SIPP

Pinot Noir Bio'S

Appellation

Alsace

Locality

Various locations around Ribeauvillé: Colmarer Weg, Streng, Mittlerer Forst...

Type of soil

The Louis SIPP parcels of land are situated in the geological fracture zone of Ribeauvillé. They constitute a territory which is highly geologically fragmented. They are above all areas with hard chalk, clay and marl from the Liassic and Triassic periods, sandstone clay, and calcareous, chalky conglomerates from the Oligocene period. The area is also characterised by silt-laden deposits, originally loessial, and by glaciais and sandy alluvium in the valley and on the plain. PINOT NOIR is also found in soils which are relatively heavy, (where clay is present), chalky, early fruiting and bearing a low yield. A high level of maturity as well as perfectly sound grapes are necessary to bring out the colour and the fruit of this grape variety more used to grow in more southern regions.

Wine character

A beautiful deep and intense red colour with glints of purple (a sign of its youth). A nose of red and black fruits. A good structure, fruity, ample and long on the palate. A wine in full phase of development toward a fine state of balance.

Tips for consuming

An ideal accompaniment to cold meats and salads, poultry and white meat, red meat and game, and finally with cheese.

To drink immediately, but its tannins will become rounder with ageing.
